Title : Combined administration of vitamin B₁ with various hypotensive preparations

Periodical : Farm. 1. toks., 17, 30-23, Nov/Dec 1954

Abstract : Tested the effects of combined administration of vitamin B₁ with each of the following: papaverine, salsoline, and dibasol. Vitamin B₁ with papaverine prolongs the action of the papaverine. Combined administration of vitamin B₁ with salsoline increased the time of hypotensive action in only 45% of the experiments. Combining vitamin B₁ with dibasol increases the hypotensive effect of the latter by prolonging the time and extent of its action. The experiments were conducted on cats of both sexes under urethane anesthesia. Five tables; no references.

Institution: Laboratory of General Pharmacology (Head - Acting Member Acad Med Sci USSR V. I. Skvortsov) Inst of Pharmacology, Experimental Chemotherapy and Chemoprophylactics, Acad Med Sci USSR

✓ Influence of vitamin B₁ on blood pressure and analysis of
the mechanism of the effect. N. B. Vysotskaya. *Farm-
akol. i Toksikol.* 18, No. 6, 33-8 (1955). In test, with
cats vitamin B₁ had a hypotensive effect; amt. and dura-
tion were in direct relation to dose. Vitamin B₁ intensified
the action of $\text{AcOCH}_2\text{CH}_2\text{NMe}_2\text{OH}$. Sympatholytic drugs
such as ychimbine eliminate the hypotensive effect of vi-
tamin B₁ and the vitamin even has a pressor effect when
perfused through the isolated carotid sinus. Atropinization
of test animals does not influence the hypotensive action.

"Effect of Gangliolytics on the Content of Phosphoric Fractions in the Superior Cervical Ganglion," by N. B. Vysotskaya, Laboratory of Special Pharmacology (head, Prof V. V. Zakusov, Active Member of the Academy of Medical Sciences USSR), Institute of Pharmacology and Chemotherapy, Academy of Medical Sciences USSR, Farmakologiya i Toksikologiya, Vol 20, No 2, Mar/Apr 57, pp 12-15

Experiments in which pachycarpine, tetraethylammonium, nicotine, pentamine, and hexone were utilized as gangliolytic agents revealed that pachycarpine in doses of 10-15 milligrams per kilogram of body weight, nicotine in doses of 1-1.2 milligrams per kilogram of body weight, pentamine in doses of 1-2 milligrams per kilogram of body weight, and tetraethylammonium in doses of 10-15 milligrams per kilogram of body weight, when administered into the superior cervical ganglion of cats, in addition to their blocking action produced a drop in the total amount of fractions of adenosine triphosphate, adenosine diphosphate, and phosphocreatine. The results were different when hexone was used: despite its full blocking effect on ganglion transmission, it caused no change in the content of phosphoric fractions, although it did cause a drop of 38 percent in phosphocreatine. The experiments established that while some gangliolytics -- pachycarpine, nicotine, pentamine, and tetraethylammonium -- in addition to their blocking action cause a drop in the content of phosphoric fractions, others, like hexone, carry out their blocking action while causing no appreciable change in the content of phosphoric fractions. TITLE: Conditions of Storage and Losses of Weight in Frozen Meat in Refrigerated Chamber equipped with Heat Insulation Jacket

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 5, pp 26-30 (USSR)

ABSTRACT: The article describes tests conducted by VNIKhI with a view to determining the effect of jackets surrounding refrigeration rooms. Tests were conducted on an extensive scale over a period of 2 years. Under ordinary conditions the average prevailing temperature was -17°C with a humidity content of the air of 97%. The loss of weight in frozen meat due to influx of heat from the surrounding cold chambers was twice as big as the loss observed in regard to frozen meat, stored in a jacket surrounded cold chamber. Losses can still be reduced, if by means of proper automation a steadier temperature is maintained. To prevent air currents from taking place inside, it is necessary to place in the chamber insulated partitions. Temperature in the jacket must not be inferior to the temperature in the chamber by more than one degree. It is important that the walls separating cold chambers and jackets

Card 1/2

SOV/66-59-5-6/35

Conditions of Storage and Losses of Weight in Frozen Meat in Refrigerated Chamber equipped with Heat Insulation Jacket

should be properly insulated. Tests were carried out in the Moscow Refrigeration Warehouse Nr 12 and revealed that the jacket-enclosed cold storage room constitutes a great improvement in the prevention of meat shrinkage and reduction of losses in weight. In the case of a single story refrigeration plant, a better solution for the design of the jacket may be found by providing a forced air circulation inside the jacket through a narrow air hole.

There are 4 tables, 1 diagram, 1 graph and 4 references, of which 3 are Soviet and 1 English.

TITLE: Determination of the Modulation Depth Factor of the
Inductance of a Parametric Generator (Ob opredelenii
koeffitsienta glubiny modulyatsii induktivnosti
parametricheskogo generatora)

PERIODICAL: Izv. Tomskogo politekhn.in-ta, 1956, 82, pp. 70-72

ABSTRACT: It is demonstrated that for the selection of the para-
meters of the excitation circuit of a parametric
generator and for the determination of conditions of
operational stability, it is necessary to know the value
"m" or the inductance modulation depth factor. A method
of determining the approximate value of the magnitude "m"
is suggested in the process of designing a parametric
generator for any outline of the stator and rotor body
plates.

SOV/144-58-7-15/15

AUTHOR: Vysotskaya, Veronika Mikhaylovna, Candidate of Technical Sciences, Acting Head of the Chair

TITLE: The Air Gap Coefficient of a Parametric Generator
(Koeffitsient vozdušnogo razora parametricheskogo generatora)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Elektromekhanika, 1958, Nr 7, pp 128-130 (USSR)

ABSTRACT: Since a parametric generator of the induction type has no rotor windings it can run at high peripheral speeds and generate current at high frequency. Such generators are of low power factor but in some cases this is not important. In designing an induction parametric generator it is necessary to determine the air gap coefficient. In normal machine design practice empirical formulae are of the form given in expressions (1) and (2) in which the notation is derived from Fig 2. For normal machines the formulae give reasonably accurate results but we have found by making tests that they may give very inaccurate results for induction parametric generators. Test results on an induction parametric generator can be used to give the air gap coefficient of a generator being

Card 1/2

SOV/144-58-7-15/15

The Air Gap Coefficient of a Parametric Generator

designed provided that the tooth and slot profiles of the rotor and stator of the test and designed generators are the same. In this case formulae (1) and (2) can be used to determine the relative change in the air gap factor of the generator being designed as compared with the generator tested. It is then shown that more accurate results are obtained when designing variants of a parametric generator if formulae (3), (4) and (5) are used for the various constants. It is accordingly recommended to use these formulae in the design of induction parametric generators.

TITLE: Detection of dislocation in silicon single-crystals in chemical etching

PERIODICAL: Referativnyy zhurnal, Elektronika i yeye primeneniye, no. 3, 1963, 16, abstract 3B101 (Sb. tr. Mosk. vech. metallurg. in-ta, no. 4, 1962, 285 - 291)

TEXT: Experiments were carried out on selecting an etching agent for dislocation detection in Si single-crystals. A 3-component system of HF, HNO₃, and CH₃COOH was investigated as well as a system of the same acids, but with Br additions. The optimum relation of the acids was found to be equal to (1:3:3). If small amounts of Br (0.08 ml) are added to this system, the time of etch pit detection decreases to some degree, and if increased amounts of Br are added, the density of detected etch pits reduces greatly. It was found that the acid concentration had a great effect on the quality of etching. Optimum acid concentrations are: for HF - 50-52%, for HNO₃ - 60-62%, and for CH₃COOH - glacial concentration.

Card 1/2

Detection of dislocation ...

S/275/63/000/003/009/021
A052/A126

Sometimes in the process of work an oxidation of the sample was observed which was caused by the presence of excess water in the etching agent at a lowered HNO_3 concentration. To bind the water in the etching solution, acetic acid was replaced by acetic anhydride. This agent proved to be the best; it enables one to detect maximum density of etch pits and gives the most distinct picture. There are 14 references.

TITLE: Local Varieties of Pears as Resources of Horticulture
(Mestnyye sorta grush - resursy sadovodstva)

PERIODICAL: Priroda, 1958, Nr 2, pp 108-110 (USSR)

ABSTRACT: The author gives a history of pear-growing in the USSR. Varieties of pears were imported and grown to the detriment of the local varieties. These local varieties, however, have proved very resistant to frost, with good yields and eating qualities. A scientific study of the local varieties has been made and grafting experiments have proved successful. Several of these varieties are described. There is 1 photo and 2 Soviet references.
